

Modelli di computazione per la verifica formale

Workshop FORMA e sostanza — DIBRIS

Enrico Ghiorzi

6 Luglio 2023

What I have been up to:

- ▶ PhD in category theory (enriched and internal categories)
- ▶ categorical semantics of inductive data types (ADTs, nested types, GADTs) at Appstate
- ▶ formal methods applied to autonomous (robotic) systems, at IIT (synthesis of temporal logic contrastive explanations)
- ▶ CONVINCE project on verification and monitoring of autonomous systems, at DIBRIS

Contents

Categories

Functors

(Non-)Deterministic Automata

Further developments

Definition

A **category** \mathbf{C} is given by

- ▶ a class of **objects** $\text{Ob}_{\mathbf{C}}$
- ▶ a class of **morphisms** $\text{Morph}_{\mathbf{C}}$
- ▶ a **composition** operation \circ
- ▶ an **identity** operation id

such that

- ▶ each morphism $f \in \text{Morph}_{\mathbf{C}}$ has a **domain** and a **codomain** object, and we write $f: A \rightarrow B$
- ▶ each object A has an identity morphism $\text{id}_A: A \rightarrow A$
- ▶ consecutive morphisms $f: A \rightarrow B$ and $g: B \rightarrow C$ can be composed into $g \circ f: A \rightarrow C$
- ▶ composition is associative, and unitary with respect to identity

Example

The category **Set** has

- ▶ Sets as objects
- ▶ Functions between sets as morphisms
- ▶ Composition of functions as composition
- ▶ Identity function on a set as identity

Example

The category **Set_{fin}** has

- ▶ Finite sets as objects
- ▶ Functions between finite sets as morphisms
- ▶ Composition of functions as composition
- ▶ Identity function on a finite set as identity

Definition

Given categories \mathbf{C} and \mathbf{D} , a **functor** $F: \mathbf{C} \rightarrow \mathbf{D}$ is given by

- ▶ an **object component** $F_0: \text{Ob}_{\mathbf{C}} \rightarrow \text{Ob}_{\mathbf{D}}$
- ▶ a **morphism component** $F_1: \text{Morph}_{\mathbf{C}} \rightarrow \text{Morph}_{\mathbf{D}}$

preserving composition and identity

$$F_1(g \circ_{\mathbf{C}} f) = F_1(g) \circ_{\mathbf{D}} F_1(f) \quad F_1(\text{id}_A) = \text{id}_{F_0(A)}$$

Definition

A **coalgebra** of an (endo)functor $F: \mathbf{C} \rightarrow \mathbf{C}$ on a carrier object A is a morphism $A \rightarrow F(A)$

A morphism of coalgebrae $A \xrightarrow{\alpha} F(A)$ and $B \xrightarrow{\beta} F(B)$ is a morphism $f: A \rightarrow B$ such that

$$\begin{array}{ccc} A & \xrightarrow{\alpha} & F(A) \\ \downarrow f & & \downarrow F(f) \\ B & \xrightarrow{\beta} & F(B) \end{array}$$

Deterministic Automata

Definition (Jacobs)

A **deterministic automaton** with

- ▶ set of inputs I
- ▶ set of outputs O

is a coalgebra for the functor $\mathbf{Set} \rightarrow \mathbf{Set}$

$$F(-) = (-)^I \times O$$

that is, a function

$$X \xrightarrow{\langle t, o \rangle} X^I \times O$$

where

- ▶ $t: X \times I \rightarrow X$ is the transition function
- ▶ $o: X \rightarrow O$ is the observation function

Non-Deterministic Automata

Definition (Jacobs)

A **non-deterministic automaton** with

- ▶ set of inputs I
- ▶ set of outputs O

is a coalgebra for the functor $\mathbf{Set} \rightarrow \mathbf{Set}$

$$F(-) = \mathcal{P}(-)^I \times O$$

that is, a function

$$X \xrightarrow{\langle t, o \rangle} \mathcal{P}(X)^I \times O$$

where

- ▶ $t \subseteq X \times I \times X$ is the transition relation
- ▶ $o: X \rightarrow O$ is the observation function

Example

A **labelled program graph** is a non-deterministic automata with trivial output $O = \mathbb{1}$.

Example

Replacing **Set** with **Set_{fin}** we model finite automata.

Morphisms of non-deterministic automata

Definition

Given non-deterministic automata as coalgebras

$$X \xrightarrow{\langle t_X, o_X \rangle} \mathcal{P}(X)^I \times O \quad \text{and} \quad Y \xrightarrow{\langle t_Y, o_Y \rangle} \mathcal{P}(Y)^I \times O$$

a **homomorphism** between them is given by a function $f: X \rightarrow Y$ such that

$$\begin{array}{ccc} X & \xrightarrow{\langle t_X, o_X \rangle} & \mathcal{P}(X)^I \times O \\ f \downarrow & & \downarrow \mathcal{P}(f)^I \times \text{id}_O \\ Y & \xrightarrow{\langle t_Y, o_Y \rangle} & \mathcal{P}(Y)^I \times O \end{array}$$

where $\mathcal{P}(f)^I$ sends $h: I \rightarrow \mathcal{P}(X)$ into $i \in I \mapsto f(h(i)) \subseteq Y$.

Lemma (Jacobs)

$f: X \rightarrow Y$ is a homomorphism of coalgebras iff

- ▶ $x \downarrow o \implies f(x) \downarrow o$ for $x \in X$ and $o \in O$
- ▶ $x \xrightarrow{i} x' \implies f(x) \xrightarrow{i} f(x')$ for $x, x' \in X$ and $i \in I$
- ▶ $f(x) \xrightarrow{i} y \implies \exists x' \in X. f(x') = y$ and $x \xrightarrow{i} x'$ for $x \in X, y \in Y$ and $i \in I$

- ▶ For some functors F there is a “special” coalgebra: the **terminal** coalgebra
- ▶ Via terminal coalgebrae, the **behavior** of an algebra can be defined
- ▶ Bisimilarity is characterized via behavior: two states have the same behavior if and only if they have the same behavior
- ▶ As corollary: bisimilarity on the final coalgebra is equality
- ▶ Other models of computation can be modeled with other categorical models, then they can be put in relation via functors
